

HOW TO PARTICIPATE

Supply assets on K2

Earn yield by supplying assets to a K2 market. Supplied assets can also serve as collateral, unlocking borrowing power against your position.

01 Connect your wallet

Open the app and select **Connect Wallet**. K2 supports Stellar wallets through the standard wallet picker — approve the connection and your address loads into the panel.

Health Factor ⓘ

Connect Wallet

BEFORE YOU START

You'll need **XLM for network fees** plus the asset you want to supply. Your Health Factor shows “--” until a position exists — that's normal.

02 Pick a market & asset

Head to **Markets**. The Primary Market lists every supported asset with live **Supply APY**, borrow APR, and liquidity. Click any row to expand its full details.

Primary Market						
Live K2 market data. Fetched 10:41

LIQUIDATION THRESHOLD

85%

RESERVE FACTOR

10%

BORROW CAP

100K

PRICE

\$0.9996

LIQUIDITY

\$5

LTV

The share of your supplied value you can **borrow against**. 80% LTV means \$100 supplied unlocks up to \$80 of borrowing power.

LIQUIDATION THRESHOLD

The point where a position becomes **eligible for liquidation**. The gap between LTV and threshold is your safety buffer.

RATES & CAPS

APY and APR are **variable**, set by utilization along the rate curve. Borrow caps limit total exposure per asset.

04 Enter an amount & review

Keep the **Supply** tab selected, choose your market and asset, then enter an amount — or hit **Max**. **Collateral is enabled by default** — leave it on to unlock borrowing power, or switch it off if you only want yield. Select **Review Supply** to see final terms.

AMOUNT

Enter how much to supply. The Stats panel previews your position and **Health Factor** before you commit.

COLLATERAL — ON BY DEFAULT

New supplies are collateralized automatically. **Toggle it off during supply** if you don't want the asset backing loans.

REVIEW SUPPLY

Opens a final confirmation with the amount, APY, and collateral setting — **nothing moves until you sign**.

05 Approve & sign

Confirm the transaction in your wallet

Your wallet pops up with the exact transaction K2 built. Verify the asset and amount match what you reviewed, then sign. The deposit settles on Stellar in seconds and your supplied balance appears immediately.

06 Track it on your Dashboard

Your new position shows under **Supplied Assets**. The green **Collateral** pill confirms it's backing your borrowing power — **on by default**. Toggle it off here or during supply if you don't want it collateralized; collateral-enabled assets raise your borrow limit but can be liquidated if your Health Factor falls below 1.

YIELD ACCRUES AUTOMATICALLY
Interest compounds into your supplied balance — **no claiming needed** for base APY.

WITHDRAW ANY TIME
Subject to market liquidity and any **collateral your loans still require**.

COLLATERAL = BORROWING POWER
Collateral-enabled supplies set your **borrow limit** — see Guide 02 to put it to work.

HOW TO PARTICIPATE

Borrow against your collateral

Once you've supplied collateral, you can borrow any listed asset against it. Your Health Factor is the number to watch — it measures how safe your position is.

01 Switch to Borrow & choose an asset

Select the **Borrow** tab — the interface turns purple for borrow actions. Pick your market and asset from the dropdown, then enter an amount within your available borrowing power.

AVAILABLE TO BORROW

Set by your collateral value × each asset's **LTV**. The panel shows your live limit for the selected asset.

BORROW APR

Interest accrues at a **variable rate** driven by market utilization. Check the current APR in the Stats section before confirming.

02 Check the impact on your Health Factor

The Stats section previews your wallet, supplied, and borrowed balances plus the APR — and shows how this borrow moves your **Health Factor** before you sign anything.

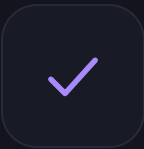

Stats	
Wallet	--
Supplied	--
Borrowed	--
APY	2.00%
Distribution APY	0.00%

HEALTH FACTOR, IN ONE LINE

Collateral value (weighted by liquidation thresholds) divided by what you owe. **Borrowing more pushes it down. Supplying more or repaying pushes it up.**

03 Review, approve & sign

Review Borrow → sign in your wallet

Select **Review Borrow**, confirm the amount, APR, and resulting Health Factor, then sign the transaction in your Stellar wallet. The borrowed asset lands directly in your wallet and interest starts accruing from that moment.

04 Manage the loan from your Dashboard

Your loan appears under **Borrowed Assets** with the live APR shown in red — that's the interest you're paying. Use **Borrow** to draw more, or **Repay** any time to reduce debt and restore your Health Factor.

Repay any time — no lock-up

Borrow

Repay

+ Add to Wallet

KEEP A BUFFER

Prices move. Borrowing right up to your limit leaves no room — most users keep their Health Factor **comfortably above 2**.

IF HF FALLS BELOW 1

The position becomes eligible for **liquidation**: collateral is sold to repay the debt, with a liquidation penalty. Repay or add collateral before it gets there.

WHERE THE BORROWED ASSET GOES

Borrowed funds land **directly in your wallet** — use them anywhere on Stellar. The debt stays on K2, accruing at the live APR, until you repay it here.

HOW TO PARTICIPATE

Manage your position

The Dashboard is mission control: every position, its health, and every action — supply, withdraw, swap, claim, repay — lives here.

01 Reading the Dashboard

One card per market. Supplied assets on the left (value in **green**), borrowed on the right (in **purple**). The header shows the three numbers that define your position:

Primary Market

HEALTH FACTOR **3.48** NET APY **-11.75%** BORROW LIMIT **\$9.42**

Borrow

Repay

+ Add to Wallet

HEALTH FACTOR

Your safety margin. **Above 2 is comfortable; below 1 means liquidation.** Watch it whenever prices move or you borrow more.

NET APY

What you earn on supplies minus what you pay on borrows, blended across the position. **Negative means interest paid exceeds interest earned.**

BORROW LIMIT

Total borrowing power from your collateral at current LTVs. **Headroom between debt and limit is your buffer.**

02 Three habits of healthy positions

01 · BUFFER

Keep Health Factor **above 2**. Volatile collateral needs more room than stables.

02 · RATES MOVE

APY and APR are **utilization-driven** and change block to block. Recheck after big market moves.

03 · ACT EARLY

If HF trends toward 1, **repay or add collateral** — don't wait for the liquidation engine to do it for you.

Supply

Withdraw

Swap

Claim

+ Add to Wallet

SUPPLY

Add more of the asset — grows your yield and (if collateral) your borrow limit.

WITHDRAW

Pull assets back to your wallet. Limited by market liquidity and by whatever collateral your loans still require.

SWAP

Rotate one supplied asset into another without leaving the protocol — switch collateral in a single step.

CLAIM

Collect any distribution rewards your position has earned on top of base APY.

ADD TO WALLET · COLLATERAL

Add to Wallet registers the token in your wallet's asset list. The Collateral pill toggles whether this asset backs your loans — it's on by default when you supply; turning it off requires enough remaining collateral to cover existing debt.
